EDUCATION

University of California, San Diego

B.S. in Computer Engineering – GPA: 3.9

Sept. 2023 – June 2027

San Diego, CA

- **Relevant Courses:** Linear Algebra, Analog Design, Advanced Data Structures and Object-Oriented Design, Discrete Mathematics, Calculus I/II/III, and Systems Programming

EXPERIENCE

Embedded Software Engineer Intern

Viasat

May 2026 - Sept. 2026

San Diego, CA

- Designed and deployed a platform-agnostic REST API for satellite internet modems, standardizing data exchange and status requests across 2 distinct modem hardware and OS environments, with forward compatibility.
- Architected seamless interoperability between a modern Rust application and legacy C/C++ services using FFI and bindgen, eliminating the need for full rewrites. Developed abstraction layers in C/C++ to forward information from existing services to our core daemon.
- Integrated the main daemon by connecting it with existing inter-process communication protocols, including memory mapping, unlocked shared memory, and local sockets.

Lead Software Engineer

Yonder Dynamics

Oct. 2024 – Present

San Diego, CA

- Lead undergraduate rover team by leading meetings, setting goals and standards, and recruiting and on-boarding new members. Took part in multi-disciplinary work, especially with controls and electronics.
- Wrote mission-critical code in C++ and Python over a ROS/ROS2 platform to drive motor functions, arm control, and inverse kinematics. Utilized software tools like can-utils, SNMP, Foxglove, and more, to improve development.
- Utilized CAN bus protocol between multiple high-frequency nodes (BLDC controllers), eventually modifying the existing hardware abstraction layer to expand on timing sending, response callback, and publishing the data.
- Integrated features with the rest of the control pipeline, including progressively adding features to the frontend (React/Redux) that integrated with platform-level systems to improve driver ease-of-use and feasibility for autonomous portions.

Research Assistant and Data Scientist

UCSD, School of Global Policy and Strategy

Dec. 2025 – Present

San Diego, CA

- Applied statistical and machine learning techniques to analyze massive datasets (500M+ records) using Python (NumPy, Pandas, PySpark). Performed multi-stage record matching on 7 million distinct records.
- Leveraged SLURM-managed batch computing and memory-aware data pipelines to process large-scale data on remote HPC infrastructure.

PROJECTS

Full-Stack Radio Astronomy Website | hlineobs.com | HTML/CSS/JS, Python, SQL, Linux

Jun. 2025

- Built a remote radio astronomy system designed to observe the hydrogen spectrum; developed Python DSP pipelines to process signals and generate visualizations (e.g., PSD vs. time) onboard a hardware limited Raspberry Pi; built an automated data pipeline to email users automatically
- Designed a Flask backend with PostgreSQL to manage and store experiment requests, status updates, and act as an intermediary between the Pi and web interface; Developed backend plotting for the dynamic web interface.
- Developed an easy-to-use frontend in HTML, CSS, and JavaScript, allowing users to define and submit custom observation experiments through a web interface;

TECHNICAL SKILLS

Languages: Python, C++, C, Rust, Java, Javascript, HTML, CSS, SystemVerilog (HDLs), Bash Scripting, Assembly, Matlab, SQL/PostgreSQL

Frameworks: (Parallel Programming) OpenCL; (Backend) Flask, (Frontend) React

Developer Tools: Git, Docker, Perforce, Google Cloud Platform, VS Code, Visual Studio, PyCharm

Libraries: (Python) pandas, NumPy, Matplotlib, pyLab, scikit-learn; (C++) STL, OpenCV, Qt, CMake, Make
